

RESTORING OUR SALTMARSHES

Saltmarshes provide an important habitat & natural flood defence. We're working together to protect & restore these natural coastal buffers.

Restoring our salt marshes (above) is an initiative of the Our Future Coast project.

Wednesday 14th February 2024 at 19:30:

How are salt marshes helping to protect the North West coast?

by Joseph Earl (Morecambe Bay Partnership)

Driven by climate change, coastal areas globally are facing increased risks of flooding and erosion. We'll explore the crucial role that natural coastal environments like saltmarshes, found extensively around Morecambe Bay, could play in protecting people and places from climate change into the future.

Joseph's talk will highlight the unique ecological and coastal defence value of saltmarshes and discover how we can better support and manage them. He will introduce a series of case studies around Morecambe Bay where saltmarsh is being restored through the Our Future Coast project, part of DEFRA's national flood and coastal resilience innovation programme.
